

## Project Development Phase

### Model Performance Test

Date	10 November 2022
Team ID	PNT2022TMID35483
Project Name	Project – Early Detection of Chronic Kidney Disease using Machine Learning
Maximum Marks	10 Marks

#### Model Performance Testing:

Project team shall fill the following information in model performance testing template.

S.No.	Parameter	Values	Screenshot
1.	Metrics	<b>Regression Model:</b> MAE - , MSE - , RMSE - , R2 score -  <b>Classification Model:</b> Confusion Matrix - , Accuracy Score- & Classification Report -	See Below
2.	Tune the Model	Hyperparameter Tuning - Validation Method -	See Below

#### 1. Metrics

##### Model: Random Forest Classification

**check model performance Random forest gives accurate predictions than logistic regression**

```
In [51]: accuracy_score(y_test,y_pred)
```

```
Out[51]: 0.95
```

```
In [52]: conf_mat=confusion_matrix(y_test,y_pred)
conf_mat
```

```
Out[52]: array([[52,  2],
               [ 2, 24]], dtype=int64)
```

```
In [53]: print(classification_report(y_test,y_pred))
```

	precision	recall	f1-score	support
0	0.96	0.96	0.96	54
1	0.92	0.92	0.92	26
accuracy			0.95	80
macro avg	0.94	0.94	0.94	80
weighted avg	0.95	0.95	0.95	80

```
In [54]: pickle.dump(lgr,open('CKD.pkl','wb'))
```

## 2. Tune the Model

### Hyperparameter Tuning:

- The number of features is important and should be tuned in random forest classification.
- Initially all parameters in the dataset are taken as independent values to arrive at the dependent decision of Chronic Kidney Disease or No Chronic Kidney Disease.
- But the result was not accurate so used only 8 more correlated values as independent values to arrive at the dependent decision of Chronic Kidney Disease or not.

### Validation Method:

It involves **partitioning the training data set into subsets, where one subset is held out to test the performance of the model**. This data set is called the validation data set.

Cross validation is to use different models and identify the best:

### Logistic Regression Model performance values:

#### check model performance Random forest gives accurate predictions than logistic regression

```
In [59]: accuracy_score(y_test,y_pred)
```

```
Out[59]: 0.925
```

```
In [60]: conf_mat=confusion_matrix(y_test,y_pred)
conf_mat
```

```
Out[60]: array([[48,  6],
               [ 0, 26]], dtype=int64)
```

```
In [61]: print(classification_report(y_test,y_pred))
```

	precision	recall	f1-score	support
0	1.00	0.89	0.94	54
1	0.81	1.00	0.90	26
accuracy			0.93	80
macro avg	0.91	0.94	0.92	80
weighted avg	0.94	0.93	0.93	80

```
In [54]: pickle.dump(lgr,open('CKD.pkl','wb'))
```

Hence we tested with Logistic regression and Random Forest Classification wherein the accuracy of Random Forest classification is 95% compared with Logistic Regression.
